

# Arduino-based LPG Gas Leakage Detection System

## Introduction:

The Arduino-based LPG gas leakage detection system with LCD display is a critical advancement in safety technology, designed to detect Liquefied Petroleum Gas (LPG) leaks in real-time and provide immediate alerts to prevent potential hazards. LPG is commonly used for cooking and heating purposes but can pose serious threats if leaked. This system integrates sensors, Arduino microcontrollers, and an LCD display to enhance safety measures effectively.

## **Objective:**

The primary objective of this project is to develop a reliable and cost-effective solution for detecting LPG gas leaks and providing immediate alerts with visual feedback through an LCD display. By leveraging Arduino microcontrollers and appropriate sensors, the system ensures timely notification of gas leaks, allowing users to take necessary safety measures promptly.

## **System Components:**

1. **Arduino Microcontroller:** The central processing unit responsible for data processing and controlling various system functions.
2. **LPG Gas Sensor Module:** Detects the presence of LPG gas in the surrounding environment.
3. **LED Indicator:** Provides visual alerts by blinking upon detection of gas leaks.
4. **Buzzer:** Produces audible alerts to draw immediate attention to the presence of LPG gas leaks.
5. **Power Supply:** Provides the necessary power to operate the system components.
6. **LCD Display:** Provides real-time visual feedback on gas concentration levels and system status.

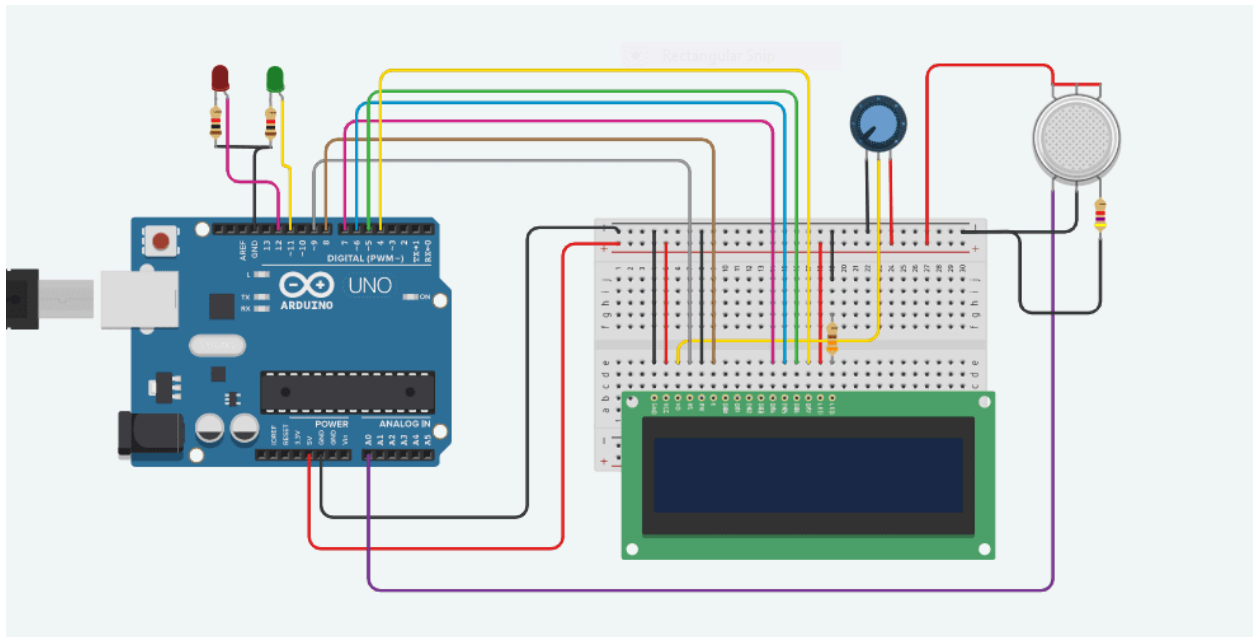

## **System Operation:**

1. **Gas Detection:** The LPG gas sensor module continuously monitors the surrounding atmosphere for the presence of LPG gas.
2. **Real-time Monitoring:** Upon detecting LPG gas leakage, the sensor module sends signals to the Arduino microcontroller.
3. **Alert Activation:** The Arduino processes signals and triggers the LED indicator to blink, activates the buzzer, and updates the LCD display with relevant information.
4. **Safety Measures:** Users are immediately alerted to gas leaks through visual and audible cues, and the LCD display provides additional information, enabling prompt evacuation and safety measures.

## **Key Features:**

1. **Real-time Detection:** The system offers real-time monitoring and detection of LPG gas leaks, ensuring swift response to potential hazards.
2. **Visual and Audible Alerts:** LED blinking, buzzer activation, and LCD display provide multi-mode alerts, enhancing user awareness of gas leaks.
3. **Information Display:** The LCD display shows gas concentration levels and system status, facilitating informed decision-making during emergencies.
4. **Cost-effective Solution:** The use of Arduino microcontrollers and readily available components makes the system affordable and accessible.
5. **Easy Integration:** System components can be easily integrated into existing setups or deployed as standalone units, simplifying installation and usage.

### Circuit Diagram :

### Conclusion:

The Arduino-based LPG gas leakage detection system with an LCD display represents a significant advancement in safety technology, offering effective detection and alert mechanisms for LPG gas leaks. By combining sensor technology, microcontroller-based control systems, and visual feedback through an LCD display, the project provides a comprehensive solution for enhancing safety in environments where LPG is utilized.
